

## Highlights Local Pod GISE- EuroPCR Salerno 18/05

We were excited by the second day of the EuroPCR POD in Salerno with a special guest: prof Raoul Bonan from Heart Institute of Montreal!

We really appreciated the EAPCI-PCR Fellows Course on “planning treatment strategies in multivessel disease”, which was characterized by a close interaction with on-site and online participants. The interactive discussion on the best strategy to adopt in case of multivessel disease was very educational for the young interventional cardiologists of Salerno.

We also attended the LIVE case on robotic coronary intervention with a close outlook on the future of percutaneous coronary intervention. We enjoyed the on-site discussion reasoning about possible future developments of various techniques.

Another great session was the Case-based Discussion “IVUS and OCT: when, how, why?”. The insights regarding coronary imaging, especially during acute coronary syndrome, were very constructive and represent a great opportunity to share opinion and ideas with prof Raoul Bonan.

Finally, the last session “Coronary microvascular dysfunction in case examples: invisible, measurable, treatable” gave us practical tips to perform and interpret correctly coronary microvascular resistance measurements.

We look forward to the third day!
