**Non-structured abstract:**

COVID-19 pandemic raised the issue to guarantee the proper level of care to patients with acute cardiovascular diseases and concomitant suspected or confirmed COVID-19 and, in the meantime safety and protection of healthcare providers.

The aim of this position paper is to provide standards to healthcare facilities and healthcare providers on infection prevention and control measures during the management of suspected and confirmed cases of 2019-nCoV infection accessing in cath-lab. The document represents the view of the Italian Society of Interventional Cardiology (GISE), and it is based on recommendations from the main World and European Health Organizations (WHO, and ECDC) as well as from the Italian Society of Anesthesia, Analgesia, Resuscitation and Intensive Care (SIAARTI).

1  
2  
3 With the spread of deadly SARS-Cov-2 (2019-nCoV) infection worldwide, it is essential to be  
4 prepared to manage suspected, probable or confirmed cases of coronavirus disease 2019  
5 (COVID-19) patients, who need non-deferrable invasive procedures in cath lab<sup>1-3</sup>. SARS-Cov-  
6  
7  
8  
9  
10 2 has the same stability on aerosol and surface of SARS-Cov-1<sup>4</sup>, but the rate of transmission is  
11 higher<sup>5</sup>. This seems related to the higher viral load in upper respiratory tract, and the potential  
12 for persons infected with SARS Cov-2 to transmit the virus while asymptomatic<sup>6,7</sup>. It has been  
13 shown that on Diamond Princess cruise ship, 17.9% of these passengers were asymptomatic  
14 carriers of COVID-19<sup>8</sup>. Others found that the proportion of pre-symptomatic transmission was  
15 48-62% for Singapore and Tianjin respectively<sup>9</sup>. Most secondary cases of virus transmission of  
16 SARS-CoV-2 appear to be occurring in community settings rather than healthcare settings.  
17 Notwithstanding, the healthcare setting is also vulnerable to the introduction and spread of  
18 SARS-CoV-2, and its environmental stability contributes to transmission of the virus in  
19 healthcare settings. To this regard, it has been reported that 41% of COVID transmission in  
20 Wuhan were hospital related<sup>10</sup>.

21  
22  
23  
24  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35 It is then fundamental to guarantee a proper protection of healthcare workers (HCWs) for  
36 their own health, to minimize the risk of spreading the infection to other health care providers  
37 and patients, and finally to guarantee the proper level of care in cath lab in case of suspected  
38 or confirmed COVID-19 patients<sup>11-13</sup>.

This position paper summarizes the view of the Italian Society of Interventional Cardiology (GISE), on the base of World Health Organization (WHO), European Centre for Disease Prevention and Control (ECDC) and Italian Society of Anesthesia, Analgesia, Resuscitation and Intensive Care (SIAARTI) recommendations<sup>14-24</sup>.

The aim is to provide standards to healthcare facilities and healthcare providers on infection prevention and control measures during the management of suspected and confirmed cases of 2019-nCoV infection accessing in cath-lab. These guidelines can be extended and adapted to other operating rooms.

1  
2  
3 The definition of suspected COVID-19 patients is continuously changing depending on  
4 epidemiological factors, so it is recommended to refer in turn to WHO updates  
5  
6  
7 (<https://www.who.int/emergencies/diseases/novel-coronavirus-2019>).  
8  
9  
10  
11  
12  
13

## 14 **1. General management of cath lab.**

### 15 **1.1 Daily checklist in cath lab.**

16  
17  
18  
19  
20  
21 If the hospital has multiple cath-labs/operating rooms, it is suggested to identify dedicated lab  
22 for the treatment of suspected or confirmed COVID-19 patients, if needed.  
23

24  
25  
26 Only clinical staff who have been trained and is therefore considered to be competent in the use  
27 of personal protective equipment (PPE) should be allowed to access the cath lab in case of  
28 suspected or confirmed COVID-19 patients.  
29  
30  
31

32  
33 Due to the spread of infection worldwide and the risk of supply shortages of PPE, it is  
34 recommended to have a dedicated registry of all the available PPE in cath lab.  
35  
36

37  
38 It is suggested to do a daily check to verify the presence of an adequate number of PPE  
39 including:  
40

- 41 - Surgical mask
- 42
- 43 - Respirator N95 or FFP2 standard and FFP3, or equivalent.
- 44
- 45 - Long-sleeved water-resistant gown
- 46
- 47 - Sterile standard gown
- 48
- 49 - Gloves
- 50
- 51 - Hair covers
- 52
- 53 - Eye protection (goggles or face shield, better if disposable)
- 54
- 55 - Apron (for aerosol-generating procedures such as intubation)
- 56
- 57 - Shoe covers due to the risk of splash from organic material or chemicals.
- 58
- 59
- 60

## 1.2 Daily checklist of crash cart.

It is advised to alert the anaesthesiologist beforehand to consider the opportunity of elective intubation before patient arrival in cath lab.

In any case, the crash cart must contain:

1. Heat and moisture exchanger (HME) filters to be placed on any interface (mask, circuit, endotracheal tube, supraglottic devices, introducer/exchange pipes)
2. Laryngoscope
3. Masks
4. Circuits
5. Endotracheal tubes
6. Supraglottic devices
7. Introducer/exchange pipes
8. Aspirator (closed system)
9. Anti-fogging system
10. Any potential useful drugs already prepared and double checked
11. Clamp, if necessary to disconnect the patient from the ventilator.

## 2. Procedures for wearing ('donning') and safe removal ('doffing') of PPE.

It is strongly suggested to print these instructions (Supplemental appendix 1) and keep them available in the lab together with PPE.

Donning/doffing manoeuvres should be performed with proper supervision by a trained observer who reads the correct sequence in the order to verify the correct execution and minimize the risk of accidental contamination (see Supplemental Movie 1 and 2 for tutorial on correct donning and doffing of PPE).

1  
2  
3 Clinical staff should be routinely trained on the correct use of PPE to be prepared for emergency  
4  
5 situations.  
6  
7  
8  
9

### 10 **2.1. Donning of PPE Before entering Cath Lab**

11  
12 All HCWs involved in the procedure must wear proper PPE before patient's arrival in cath lab  
13  
14 in a safe non-contaminated environment. The sequence is:  
15  
16

- 17 1. Remove any personal items
- 18 2. Put on the lead apron
- 19 3. Put on a first disposable gown
- 20 4. Gather the necessary PPE and check for their integrity
- 21 5. Perform hand hygiene with alcohol hand gel/rub
- 22 6. Put on the proper disposable respirator N95 or FFP2 standard (FFP3 available for  
23 anaesthesiologist and nurse helping on airways manoeuvres)
- 24 7. Put on hair cover
- 25 8. Put on shoe covers
- 26 9. Put on goggles and/or face shield avoiding any interference with the respirator
- 27 10. Perform hand hygiene
- 28 11. Put on the first pair of gloves
- 29 12. Put on a gown (sterile or not according to your role in cath lab) not using the inside tie
- 30 13. Put on a second pair of gloves (over cuff), sterile if needed.  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52

### 53 **2.2. Doffing of PPE.**

54 A safe doffing area should be identified in each cath lab, in particular if no anteroom or exists.  
55  
56 If no anteroom is available, doffing of PPE could be done inside the lab, at the end of procedure  
57  
58 and when the patient has been transferred away.  
59  
60

Only facial respirator must be removed outside the contaminated area.

1. Avoid any contact with your face, hair and eyes before of completing the entire doffing process.
2. Place any disposable PPE in the clinical waste bin.
3. Don't fill the clinical waste bin more than  $\frac{3}{4}$  in order to be able to close it safely without squeezing contaminated materials to avoid aerosolization.
4. Reprocess the not-disposable PPE.
5. Follow the sequence.

### **Inside the operating room:**

- a) **Wait until patient is out of the room; close the door**
- b) Perform hand hygiene over the gloves
- c) Peel off gown and gloves together and roll inside, slowly and carefully, avoiding aerosolization
- d) If gloves are removed separately, touch only the external part (use glove-in-glove or beak technique)
- e) Perform hand hygiene (over the internal gloves)
- f) Remove face shield and/or goggles avoiding contact with face and eyes and dispose them safely or put in a separate container for reprocessing
- g) Perform hand hygiene (over the internal gloves)
- h) Remove hair cover and dispone it safely
- i) Remove shoe covers and dispone them safely
- j) Perform hand hygiene (over the internal gloves)
- k) Remove internal gloves and dispose them safely
- l) Perform hand hygiene
- m) Step out of the operating room and immediately close the door.**

### **Outside the operating room:**

- n) Put on another pair of gloves
- o) Remove facial respirator without touching the front side of the respirator
- p) Remove the gloves
- q) Remove lead apron
- r) Perform hand hygiene with soap and water and alcohol gel/rub.

### **3. What to do before the arrival in cath-lab of a suspected or confirmed COVID-19 patient.**

1. Notify the area receiving the patient of any necessary precautions as early as possible before the patient's arrival.
2. Ensure maximal coordination to avoid steadying in waiting areas.
3. Get all other patients in cath lab away from the path the COVID patient will have to take.
4. Identify the staff that will be in contact with the patient avoiding unnecessary exposure of other members in order to reduce the risk of contamination and wasting of PPE.
5. Assign roles to each staff member.
6. Briefing with the (few) member of the dedicated staff, identify a buddy who is designated to read the instructions and supervised the correct sequence of donning and doffing.
7. Pre-warning of the anaesthesiologist to evaluate the opportunity of elective intubation, recommended before patient's arrival in the lab; otherwise, the anaesthesiologist stays outside the room with proper PPE.
8. All useful material for interventional cardiology must be stored inside the lab (for instance a full-size series of catheters, balloon-catheter and stents), avoiding entry and exit of the staff members during procedure.

- 1
- 2
- 3 9. Any useful drugs have to be prepared in advance.
- 4
- 5 10. Supervised donning PPE for all the member of the staff (it is suggested to have at least
- 6 one physician and one nurse sterile and one nurse and one technician non-sterile).
- 7
- 8
- 9
- 10 11. Only when all is prepared, accept the patient in cath lab.
- 11
- 12 12. If in spontaneous breathing, the patient must wear a surgical mask before entry the lab.
- 13
- 14
- 15
- 16
- 17
- 18

#### 19 **4. Periprocedural management of suspected or confirmed COVID-19 patients in**

#### 20 **cath-lab.**

- 21
- 22
- 23
- 24
- 25
- 26 1. Keep the door closed for the whole duration of procedure.
- 27
- 28 2. PPE-protected (but non-sterile) member staff put the patient on the operating table.
- 29
- 30 3. Avoid entry and exit from the room of the staff for bringing material (everything
- 31 necessary should be planned in advance and stored inside).
- 32
- 33 4. Non-sterile staff members moving into the operating room during the procedure should
- 34 minimize any contact with the surfaces. Before any contact (for example before opening
- 35 a tray), he should change the external gloves (or put on another pair of cleaned gloves).
- 36
- 37 5. Keep the procedure as simple as possible (only culprit lesion revascularization).
- 38
- 39
- 40
- 41
- 42
- 43
- 44
- 45
- 46
- 47
- 48

#### 49 **5. Post-procedural requirements when a suspected or confirmed COVID-19 patient**

#### 50 **leaves the cath-lab.**

- 51
- 52
- 53
- 54
- 55
- 56 1. Keep the door closed.
- 57
- 58 2. Supervised doffing as previously described; if no anteroom is available, doffing of PPE
- 59 could be done inside the room, at the end of procedure and when the patient has been
- 60 transferred away. Only facial respirator must be removed outside the contaminated area.

- 1
- 2
- 3 3. Dispose of all waste according to protocols (do not squeeze contaminated material into
- 4 the container).
- 5
- 6
- 7
- 8 4. Treat used tissues in accordance with standard procedures.
- 9
- 10 5. Get out of the operating room and keep the door closed for at least an hour prior to
- 11 performing a terminal clean (in particular for a neutral pressure room).
- 12
- 13
- 14 6. Re-useable equipment have to be decontaminated according to the manufacturer's
- 15 instructions (i.e.lead apron).
- 16
- 17
- 18
- 19 7. Notification of any new confirmed case.
- 20
- 21 8. A record of all staff providing care for suspected or confirmed 2019-nCoV cases must
- 22 be maintained.
- 23
- 24
- 25
- 26 9. If at any point a member of the staff feels as he/she has been exposed to the pathogen,
- 27 follow facility protocols.
- 28
- 29
- 30
- 31 10. Staff who have been provided care to confirmed 2019-nCoV cases, should be vigilant
- 32 for fever and any respiratory symptoms in the 14 days following the last exposure to a
- 33 confirmed case, and follow internal protocols.
- 34
- 35
- 36
- 37
- 38
- 39
- 40
- 41
- 42
- 43
- 44
- 45
- 46
- 47
- 48

**Non-structured abstract:**

COVID-19 pandemic raised the issue to guarantee the proper level of care to patients with acute cardiovascular diseases and concomitant suspected or confirmed COVID-19 and, in the meantime safety and protection of healthcare providers.

The aim of this position paper is to provide standards to healthcare facilities and healthcare providers on infection prevention and control measures during the management of suspected and confirmed cases of 2019-nCoV infection accessing in cath-lab. The document represents the view of the Italian Society of Interventional Cardiology (GISE), and it is based on recommendations from the main World and European Health Organizations (WHO, and ECDC) as well as from the Italian Society of Anesthesia, Analgesia, Resuscitation and Intensive Care (SIAARTI).

1

With the spread of deadly SARS-Cov-2 (2019-nCoV) infection worldwide, it is essential to be prepared to manage suspected, probable or confirmed cases of coronavirus disease 2019 (COVID-19) patients, who need non-deferrable invasive procedures in cath lab<sup>1-3</sup>. SARS-Cov-2 has the same stability on aerosol and surface of SARS-Cov-1<sup>4</sup>, but the rate of transmission is higher<sup>5</sup>. This seems related to the higher viral load in upper respiratory tract, and the potential for persons infected with SARS Cov-2 to transmit the virus while asymptomatic<sup>6,7</sup>. It has been shown that on Diamond Princess cruise ship, 17.9% of these passengers were asymptomatic carriers of COVID-19<sup>8</sup>. Others found that the proportion of pre-symptomatic transmission was 48-62% for Singapore and Tianjin respectively<sup>9</sup>. Most secondary cases of virus transmission of SARS-CoV-2 appear to be occurring in community settings rather than healthcare settings. Notwithstanding, the healthcare setting is also vulnerable to the introduction and spread of SARS-CoV-2, and its environmental stability contributes to transmission of the virus in healthcare settings. To this regard, it has been reported that 41% of COVID transmission in Wuhan were hospital related<sup>10</sup>.

It is then fundamental to guarantee a proper protection of healthcare workers (HCWs) for their own health, to minimize the risk of spreading the infection to other health care providers and patients, and finally to guarantee the proper level of care in cath lab in case of suspected or confirmed COVID-19 patients<sup>11-13</sup>.

This position paper summarizes the view of the Italian Society of Interventional Cardiology (GISE), on the base of World Health Organization (WHO), European Centre for Disease Prevention and Control (ECDC) and Italian Society of Anesthesia, Analgesia, Resuscitation and Intensive Care (SIAARTI) recommendations<sup>14-24</sup>.

The aim is to provide standards to healthcare facilities and healthcare providers on infection prevention and control measures during the management of suspected and confirmed cases of 2019-nCoV infection accessing in cath-lab. These guidelines can be extended and adapted to other operating rooms.

1  
2  
3 The definition of suspected COVID-19 patients is continuously changing depending on  
4 epidemiological factors, so it is recommended to refer in turn to WHO updates  
5  
6 (<https://www.who.int/emergencies/diseases/novel-coronavirus-2019>).  
7  
8  
9

11  
12  
13

## 14 **1. General management of cath lab.**

### 15 **1.1 Daily checklist in cath lab.**

16  
17  
18  
19  
20  
21 If the hospital has multiple cath-labs/operating rooms, it is suggested to identify dedicated lab  
22 for the treatment of suspected or confirmed COVID-19 patients, if needed.  
23

24  
25  
26 Only clinical staff who have been trained and is therefore considered to be competent in the use  
27 of personal protective equipment (PPE) should be allowed to access the cath lab in case of  
28 suspected or confirmed COVID-19 patients.  
29  
30  
31

32  
33 Due to the spread of infection worldwide and the risk of supply shortages of PPE, it is  
34 recommended to have a dedicated registry of all the available PPE in cath lab.  
35  
36

37  
38 It is suggested to do a daily check to verify the presence of an adequate number of PPE  
39 including:  
40

- 41 - Surgical mask
- 42
- 43 - Respirator N95 or FFP2 standard and FFP3, or equivalent.
- 44
- 45 - Long-sleeved water-resistant gown
- 46
- 47 - Sterile standard gown
- 48
- 49 - Gloves
- 50
- 51 - Hair covers
- 52
- 53 - Eye protection (goggles or face shield, better if disposable)
- 54
- 55 - Apron (for aerosol-generating procedures such as intubation)
- 56
- 57 - Shoe covers due to the risk of splash from organic material or chemicals.
- 58
- 59
- 60

## 1.2 Daily checklist of crash cart.

It is advised to alert the anaesthesiologist beforehand to consider the opportunity of elective intubation before patient arrival in cath lab.

In any case, the crash cart must contain:

1. Heat and moisture exchanger (HME) filters to be placed on any interface (mask, circuit, endotracheal tube, supraglottic devices, introducer/exchange pipes)
2. Laryngoscope
3. Masks
4. Circuits
5. Endotracheal tubes
6. Supraglottic devices
7. Introducer/exchange pipes
8. Aspirator (closed system)
9. Anti-fogging system
10. Any potential useful drugs already prepared and double checked
11. Clamp, if necessary to disconnect the patient from the ventilator.

## 2. Procedures for wearing ('donning') and safe removal ('doffing') of PPE.

It is strongly suggested to print these instructions (Supplemental appendix 1) and keep them available in the lab together with PPE.

Donning/doffing manoeuvres should be performed with proper supervision by a trained observer who reads the correct sequence in the order to verify the correct execution and minimize the risk of accidental contamination (see Supplemental Movie 1 and 2 for tutorial on correct donning and doffing of PPE).

1  
2  
3 Clinical staff should be routinely trained on the correct use of PPE to be prepared for emergency  
4  
5 situations.  
6  
7  
8  
9

### 10 **2.1. Donning of PPE Before entering Cath Lab**

11  
12 All HCWs involved in the procedure must wear proper PPE before patient's arrival in cath lab  
13  
14 in a safe non-contaminated environment. The sequence is:  
15  
16

- 17 1. Remove any personal items
  - 18 2. Put on the lead apron
  - 19 3. Put on a first disposable gown
  - 20 4. Gather the necessary PPE and check for their integrity
  - 21 5. Perform hand hygiene with alcohol hand gel/rub
  - 22 6. Put on the proper disposable respirator N95 or FFP2 standard (FFP3 available for  
23 anaesthesiologist and nurse helping on airways manoeuvres)
  - 24 7. Put on hair cover
  - 25 8. Put on shoe covers
  - 26 9. Put on goggles and/or face shield avoiding any interference with the respirator
  - 27 10. Perform hand hygiene
  - 28 11. Put on the first pair of gloves
  - 29 12. Put on a gown (sterile or not according to your role in cath lab) not using the inside tie
  - 30 13. Put on a second pair of gloves (over cuff), sterile if needed.
- 31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52

### 53 **2.2. Doffing of PPE.**

54 A safe doffing area should be identified in each cath lab, in particular if no anteroom or exists.  
55  
56 If no anteroom is available, doffing of PPE could be done inside the lab, at the end of procedure  
57  
58 and when the patient has been transferred away.  
59  
60

Only facial respirator must be removed outside the contaminated area.

1. Avoid any contact with your face, hair and eyes before of completing the entire doffing process.
2. Place any disposable PPE in the clinical waste bin.
3. Don't fill the clinical waste bin more than  $\frac{3}{4}$  in order to be able to close it safely without squeezing contaminated materials to avoid aerosolization.
4. Reprocess the not-disposable PPE.
5. Follow the sequence.

### **Inside the operating room:**

- a) **Wait until patient is out of the room; close the door**
- b) Perform hand hygiene over the gloves
- c) Peel off gown and gloves together and roll inside, slowly and carefully, avoiding aerosolization
- d) If gloves are removed separately, touch only the external part (use glove-in-glove or beak technique)
- e) Perform hand hygiene (over the internal gloves)
- f) Remove face shield and/or goggles avoiding contact with face and eyes and dispose them safely or put in a separate container for reprocessing
- g) Perform hand hygiene (over the internal gloves)
- h) Remove hair cover and dispone it safely
- i) Remove shoe covers and dispone them safely
- j) Perform hand hygiene (over the internal gloves)
- k) Remove internal gloves and dispose them safely
- l) Perform hand hygiene
- m) Step out of the operating room and immediately close the door.**

### **Outside the operating room:**

- n) Put on another pair of gloves
- o) Remove facial respirator without touching the front side of the respirator
- p) Remove the gloves
- q) Remove lead apron
- r) Perform hand hygiene with soap and water and alcohol gel/rub.

### **3. What to do before the arrival in cath-lab of a suspected or confirmed COVID-19 patient.**

1. Notify the area receiving the patient of any necessary precautions as early as possible before the patient's arrival.
2. Ensure maximal coordination to avoid steadying in waiting areas.
3. Get all other patients in cath lab away from the path the COVID patient will have to take.
4. Identify the staff that will be in contact with the patient avoiding unnecessary exposure of other members in order to reduce the risk of contamination and wasting of PPE.
5. Assign roles to each staff member.
6. Briefing with the (few) member of the dedicated staff, identify a buddy who is designated to read the instructions and supervised the correct sequence of donning and doffing.
7. Pre-warning of the anaesthesiologist to evaluate the opportunity of elective intubation, recommended before patient's arrival in the lab; otherwise, the anaesthesiologist stays outside the room with proper PPE.
8. All useful material for interventional cardiology must be stored inside the lab (for instance a full-size series of catheters, balloon-catheter and stents), avoiding entry and exit of the staff members during procedure.

  - 53
  - 54
  - 55
  - 56
  - 57
  - 58
  - 59
  - 60
9. Any useful drugs have to be prepared in advance.
  10. Supervised donning PPE for all the member of the staff (it is suggested to have at least one physician and one nurse sterile and one nurse and one technician non-sterile).
  11. Only when all is prepared, accept the patient in cath lab.
  12. If in spontaneous breathing, the patient must wear a surgical mask before entry the lab.

#### **4. Periprocedural management of suspected or confirmed COVID-19 patients in cath-lab.**

1. Keep the door closed for the whole duration of procedure.
2. PPE-protected (but non-sterile) member staff put the patient on the operating table.
3. Avoid entry and exit from the room of the staff for bringing material (everything necessary should be planned in advance and stored inside).
4. Non-sterile staff members moving into the operating room during the procedure should minimize any contact with the surfaces. Before any contact (for example before opening a tray), he should change the external gloves (or put on another pair of cleaned gloves).
5. Keep the procedure as simple as possible (only culprit lesion revascularization).

#### **5. Post-procedural requirements when a suspected or confirmed COVID-19 patient leaves the cath-lab.**

1. Keep the door closed.
2. Supervised doffing as previously described; if no anteroom is available, doffing of PPE could be done inside the room, at the end of procedure and when the patient has been transferred away. Only facial respirator must be removed outside the contaminated area.

3. Dispose of all waste according to protocols (do not squeeze contaminated material into the container).
4. Treat used tissues in accordance with standard procedures.
5. Get out of the operating room and keep the door closed for at least an hour prior to performing a terminal clean (in particular for a neutral pressure room).
6. Re-useable equipment have to be decontaminated according to the manufacturer's instructions (i.e.lead apron).
7. Notification of any new confirmed case.
8. A record of all staff providing care for suspected or confirmed 2019-nCoV cases must be maintained.
9. If at any point a member of the staff feels as he/she has been exposed to the pathogen, follow facility protocols.
10. Staff who have been provided care to confirmed 2019-nCoV cases, should be vigilant for fever and any respiratory symptoms in the 14 days following the last exposure to a confirmed case, and follow internal protocols.

## Supplemental Appendix 1. Sequence of Donning and doffing of PPE.

### **DONNING PPE SEQUENCE**

1. Remove any personal item
2. Put on the lead apron
3. Put on a first disposable gown
4. Gather the necessary PPE and check for their integrity
5. Perform hand hygiene with alcohol hand gel/rub
6. Put on the proper disposable respirator N95 or FFP2 standard (FFP3 available for anaesthesiologist and nurse helping on airways manoeuvres)
7. Put on hair cover
8. Put on shoe covers
9. Put on goggles and/or face shield avoiding any interference with the respirator
10. Perform hand hygiene
11. Put on the first pair of gloves
12. Put on a gown (sterile or not according to your role in cath lab) not using the inside tie
13. Put on a second pair of gloves (over cuff), sterile if needed.

### **DOFFING PPE SEQUENCE**

#### **Inside the operating room (or in the filter zone if available):**

- a) **Wait until patient is out of the room; close the door.**
- b) Perform hand hygiene over the gloves
- c) Peel off gown and gloves together and roll inside, slowly and carefully, avoiding aerosolization
- d) If gloves are removed separately, touch only the external part (use glove-in-glove or beak technique)
- e) Perform hand hygiene (over the internal gloves)
- f) Remove face shield and/or goggles avoiding contact with face and eyes and dispose them safely or put in a separate container for reprocessing
- g) Perform hand hygiene (over the internal gloves)
- h) Remove hair cover and dispense it safely
- i) Remove shoe covers and dispense them safely
- j) Perform hand hygiene (over the internal gloves)
- k) Remove internal gloves and dispose them safely
- l) Perform hand hygiene
- m) **Step out of the operating room and immediately close the door.**

#### **Outside the operating room:**

- n) Put on another pair of gloves
- o) Remove facial respirator without touching the front side of the respirator
- p) Remove the gloves
- q) Remove lead apron
- r) Perform hand hygiene with soap and water and alcohol gel/rub.
